DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tao et al. (WO 99/60973) in view of Morman et al. (5,883,028) and further in view of Jordan et al. (US 2001/0031954 A1).

Tao discloses all aspects of the claimed invention, but remains silent as to the L* and C* values of the printed area, the light transmittance of the nonwoven material, and the basis weight of the nonwoven material used in the backsheet.

Tao discloses an absorbent article, as shown in figure 10, comprising a liquidpermeable topsheet 54, a liquid retentive absorbent member 66, and a liquidimpermeable backsheet 52. The backsheet 52 is constructed from a breathable film
material, as disclosed on page 5, lines 22-27. The film is printed with a multicolored
graphic pattern, as disclosed on page 6, lines 21-28. A nonwoven material is laminated
to the outer side of the film, as disclosed on page 9, lines 9-12. Tao discloses
performing color difference tests on his backsheet film material, determining the
preferred b* value for the material is between 0.0 and 0.5, making the material white or
very close to it.

Art Unit: 3761

Tao does not disclose performing color difference tests on the printed area of the backsheet 52. Tao does, however, disclose using bright colors, such as royal blue, sky blue, and dark blue, in the printed area of the backsheet 52, as described on page 6, lines 21-26. These colors represent a wide range of shades ranging from light to dark, with royal blue clearly being neither very light nor very dark. The L* value is a measure of the darkness of a color, with 100 being so light it is white, and 0 being so dark it is black. Royal blue, being neither very light nor very dark, inherently lies somewhere near the center of the range, and therefore would fall into the range for the L* value disclosed in the instant claim 10. The printed areas of Tao therefore inherently meet the limitations of the instant claim 10.

The graphics disclosed by Tao in figure 10 are designed to be highly visible and clear. They inherently have chroma, though Tao remains silent as to the C* value giving a quantitative measure to the chroma. To produce a clear and visible graphic, printing colors with a high degree of quality, or chroma, is desired. It would be obvious to one of ordinary skill in the art at the time of invention to print the graphics with a C* value of between 20 and 120, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233.

Tao discloses printing designs on the backsheet of a diaper that are visible through the nonwoven material laminated to the backsheet. Jordan discloses a diaper having a backsheet comprising an impermeable layer with a printed graphic pattern and an outer layer comprising a fibrous nonwoven material, as described on page 2,

Art Unit: 3761

paragraph 0013. The nonwoven material has a light transmittance of 80%, as described on page 1, paragraph 007, so that the printed graphic pattern is highly visible through the nonwoven material, as described on page 1, paragraph 008. It would therefore be obvious to one of ordinary skill in the art at the time of invention to construct the nonwoven material of Tao with a light transmittance of 80%, as taught by Jordan, so that the printed graphic pattern is highly visible through the nonwoven material.

Tao discloses laminating a nonwoven material to a breathable film material with a basis weight of 20 to 40 g/m², as described on page 8, lines 4-9. Tao, however, remains silent as to the basis weight of the nonwoven material itself. Morman discloses a material for use as a diaper backsheet 40 comprising a breathable film 32 with a nonwoven material 12 laminated to its outer side, as described in column 1, lines 5-8, and column 9, lines 25-33. Morman discloses a basis weight of the nonwoven material as being between 30 and 45 g/m² in column 8, lines 60-64. A nonwoven material having this basis weight strengthens the film to which it is laminated without reducing the breathability of the film, as described in column 7, lines 48-50. It would therefore be obvious to one of ordinary skill in the art at the time of invention to construct the nonwoven material of Tao with a basis weight of between 30 and 45 g/m², as taught by Morman, to provide sufficient strength without reducing breathability.

Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tao et al. (WO 99/60973) in view of Morman et al. (5,883,028) and Jordan et al. (US

Art Unit: 3761

2001/0031954 A1), as applied to claim 10 above, and further in view of McCormack et al. (WO 00/38915).

Tao discloses all aspects of the claimed invention with the exception of a b* value less than 0 and greater than -0.5.

Tao discloses on page 5, lines 12-13, that consumer acceptance for films having a yellow tint is low.

McCormack discloses a film laminate for use as a backsheet of an absorbent article, as described on page 1, lines 4-5 and 9-10. The film has a b* value of -0.2, as disclosed on page 22, lines 27-29, which results in a significantly reduced yellow tint.

It would therefore be obvious to one of ordinary skill in the art at the time of invention to construct the backsheet of Tao such that it has a b* value of -0.2, as taught by McCormack, in order to reduce the yellow appearance of the backsheet, since Tao discloses a yellow appearance is undesirable.

Response to Arguments

Applicant's arguments with respect to the light transmittance and basis weight of the nonwoven material have been considered but are moot in view of the new ground(s) of rejection.

Applicant's arguments with respect to the C* and L* values have been fully considered but they are not persuasive. Tao discloses colors that inherently fall within the claimed ranges. Applicant's argument that royal blue, which is disclosed by Tao, may be present in a very light shade is not persuasive. A light shade of royal blue

Art Unit: 3761

blue does inherently fall within the claimed range for the L* value. The chromatic differences between the colors disclosed by Tao (e.g. sky blue, royal blue, and dark blue) are distinct, and therefore the printed graphic pattern of Tao will inherently fall within the claimed range for the C* value.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to C. Lynne Anderson whose telephone number is (703) 306-5716. The examiner can normally be reached on Monday through Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Weilun Lo can be reached on (703) 308-1957. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-1148.
